Spatial Data Structures

- Data structures to store geometric information
- Sample applications
  - Collision detection
  - Location queries
  - Chemical simulations
  - Rendering
- Spatial data structures for ray tracing
  - Object-centric data structures (bounding volumes)
  - Space subdivision (grids, octrees, BSP trees)
  - Speed-up of 10x, 100x, or more

Hierarchical Bounding Volumes

- Faster intersections
  - Faster ray-object intersections
    - Object bounding volume
    - Efficient intersectors
  - Fewer ray-object intersections
    - Hierarchical bounding volumes (boxes, spheres)
    - Spatial data structures
    - Directional techniques
- Fewer rays
  - Adaptive tree-depth control
  - Stochastic sampling
- Generalized rays (beams, cones)

Bounding Volumes

- Wrap complex objects in simple ones
- Does ray intersect bounding box?
  - No: does not intersect enclosed objects
  - Yes: calculate intersection with enclosed objects
- Common types:
  - Sphere
  - Axis-aligned Bounding Box (AABB)
  - Oriented Bounding Box (OBB)
  - 6-dop
  - Convex Hull

Selection of Bounding Volumes

- Effectiveness depends on:
  - Probability that ray hits bounding volume, but not enclosed objects (tight fit is better)
  - Expense to calculate intersections with bounding volume and enclosed objects
- Amortize calculation of bounding volumes
- Use heuristics

Hierarchical Bounding Volumes

- With simple bounding volumes, ray casting still requires $O(n)$ intersection tests
- Idea: use tree data structure
  - Larger bounding volumes contain smaller ones etc.
  - Sometimes naturally available (e.g., human figure)
  - Sometimes difficult to compute
- Often reduces complexity to $O(\log(n))$
Ray Intersection Algorithm

- Recursively descend tree
- If ray misses bounding volume, no intersection
- If ray intersects bounding volume, recurse with enclosed volumes and objects
- Maintain near and far bounds to prune further
- Overall effectiveness depends on model and constructed hierarchy

Spatial Subdivision

- Bounding volumes enclose objects, recursively
- Alternatively, divide space (as opposed to objects)
- For each segment of space, keep a list of intersecting surfaces or objects
- Basic techniques:
  - Uniform Spatial Sub
  - Quadtree/Octree
  - kd-tree
  - BSP-tree

Grids

- 3D array of cells (voxels) that tile space
- Each cell points to all intersecting surfaces
- Intersection algorithm steps from cell to cell

Caching Intersection points

- Objects can span multiple cells
- For A need to test intersection only once
- For B need to cache intersection and check next cell for any closer intersection with other objects
- If not, C could be missed (yellow ray)

Assessment of Grids

- Poor choice when world is non-homogeneous
- Grid resolution:
  - Too small: too many surfaces per cell
  - Too large: too many empty cells to traverse
  - Can use algorithms like Bresenham’s for efficient traversal
- Non-uniform spatial subdivision more flexible
  - Can adjust to objects that are present

Outline

- Hierarchical Bounding Volumes
- Regular Grids
- Octrees
- BSP Trees
Quadtrees

- Generalization of binary trees in 2D
  - Node (cell) is a square
  - Recursively split into 4 equal sub-squares
  - Stop subdivision based on number of objects
- Ray intersection has to traverse quadtree
- More difficult to step to next cell

Octrees

- Generalization of quadtree in 3D
  - Each cell may be split into 8 equal sub-cells
  - Internal nodes store pointers to children
  - Leaf nodes store list of surfaces
- Adapts well to non-homogeneous scenes

Assessment for Ray Tracing

- Grids
  - Easy to implement
  - Require a lot of memory
  - Poor results for non-homogeneous scenes
- Octrees
  - Better on most scenes (more adaptive)
  - Alternative: nested grids
  - Spatial subdivision expensive for animations
  - Hierarchical bounding volumes
    - Natural for hierarchical objects
    - Better for dynamic scenes

Other Spatial Subdivision Techniques

- Relax rules for quadtrees and octrees
  - k-dimensional tree (k-d tree)
    - Split at arbitrary interior point
    - Split one dimension at a time
- Binary space partitioning tree (BSP tree)
  - In 2 dimensions, split with any line
  - In k dims, split with k-1 dimensional hyperplane
  - Particularly useful for painter’s algorithm
  - Can also be used for ray tracing

Outline

- Hierarchical Bounding Volumes
- Regular Grids
- Octrees
- BSP Trees

BSP Trees

- Split space with any line (2D) or plane (3D)
- Applications
  - Painters algorithm for hidden surface removal
  - Ray casting
- Inherent spatial ordering given viewpoint
  - Left subtree: in front, right subtree: behind
- Problem: finding good space partitions
  - Proper ordering for any viewpoint
  - How to balance the tree
Building a BSP Tree
• Use hidden surface removal as intuition
• Using line 1 or line 2 as root is easy

Splitting of surfaces
• Using line 3 as root requires splitting

Building a Good Tree
• Naive partitioning of $n$ polygons yields $O(n^2)$ polygons (in 3D)
• Algorithms with $O(n^2)$ increase exist
  – Try all, use polygon with fewest splits
  – Do not need to split exactly along polygon planes
• Should balance tree
  – More splits allow easier balancing
  – Rebalancing?

Painter’s Algorithm with BSP Trees
• Building the tree
  – May need to split some polygons
  – Slow, but done only once
• Traverse back-to-front or front-to-back
  – Order is viewer-direction dependent
  – What is front and what is back of each line changes
  – Determine order on the fly

Details of Painter’s Algorithm
• Each face has form $Ax + By + Cz + D$
• Plug in coordinates and determine
  – Positive: front side
  – Zero: on plane
  – Negative: back side
• Back-to-front: inorder traversal, farther child first
• Front-to-back: inorder traversal, near child first
• Do backface culling with same sign test
• Clip against visible portion of space (portals)

Clipping With Spatial Data Structures
• Accelerate clipping
  – Goal: accept or reject whole sets of objects
  – Can use an spatial data structures
• Scene should be mostly fixed
  – Terrain fly-through
  – Gaming
  – Viewpoint
