University of Southern California
Texture Mapping

• A way of adding surface details

• Two ways can achieve the goal:
  – Model the surface with more polygons
    » Slows down rendering speed
    » Hard to model fine features
  – Map a texture to the surface
    » This lecture
    » Image complexity does not affect complexity of processing

• Efficiently supported in hardware
Trompe L’Oeil (“Deceive the Eye”)

- Windows and columns in the dome are painted, not a real 3D object

- Similar idea with texture mapping:

  Rather than modeling the intricate 3D geometry, replace it with an image!

Jesuit Church, Vienna, Austria
Map textures to surfaces

An image

Image mapped to a 3D polygon

The polygon can have arbitrary size, shape and 3D position
The texture

- Texture is a bitmap image
  - Can use an image library to load image into memory
  - Or can create images yourself within the program

- 2D array:
  \[
  \text{unsigned char texture}[\text{height}][\text{width}][4]
  \]

- Or unrolled into 1D array:
  \[
  \text{unsigned char texture}[4*\text{height}*\text{width}]
  \]

- Pixels of the texture are called texels

- Texel coordinates (s,t) scaled to \([0,1]\) range
Texture map

(0,1) (0,0) (1,0) (1,1)

3D polygon

(0,0) (1,0) (1,1)

Texture image
Texture map

texture image

3D polygon
Texture coordinates

For each pixel, lookup into the texture image to obtain color.
The “st” coordinate system

Note: also called “uv” space
Texture mapping: key slide

triangle in 3D

(0.1, 0.7) s = 0.1 t = 0.7
(0.7, 0.55) s = 0.7 t = 0.55
(0.35, 0.05) s = 0.35 t = 0.05
(-2, 1, 0)
Specifying texture coordinates in OpenGL (core profile)

- Use VBO

- Either create a separate VBO for texture coordinates, or put them with vertex positions into one VBO

\[
\begin{align*}
  s &= 0.1 \\
  t &= 0.7 \\
  s &= 0.35 \\
  t &= 0.05 \\
  s &= 0.7 \\
  t &= 0.55
\end{align*}
\]
Specifying texture coordinates in OpenGL (compatibility profile)

- Use `glTexCoord2f(s,t)`
- State machine: Texture coordinates remain valid until you change them
- Example (from the previous slide):

```c
glEnable(GL_TEXTURE_2D); // turn texture mapping on
glBegin(GL_TRIANGLES);
    glTexCoord2f(0.35,0.05); glVertex3f(2.0,-1.0,0.0);
    glTexCoord2f(0.7,0.55); glVertex3f(-2.0,1.0,0.0);
    glTexCoord2f(0.1,0.7); glVertex3f(0.0,1.0,0.0);
glEnd();

glDisable(GL_TEXTURE_2D); // turn texture mapping off
```
What if texture coordinates are outside of $[0,1]$?
Solution 1: Repeat texture

```c
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_REPEAT)
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_REPEAT)
```
Solution 2: Clamp to [0,1]

```c
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_S, GL_CLAMP_TO_EDGE)
glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_WRAP_T, GL_CLAMP_TO_EDGE)
```

Use this color

Use this color at point $(s, t)$
Combining texture mapping and shading

Model

Model + Shading

Model + Shading + Textures

At what point do things start looking real?

Outline

- Introduction
- Filtering and Mipmaps
- Non-color texture maps
- Texture mapping in OpenGL
Texture interpolation

(s,t) coordinates typically not directly at pixel in the texture, but in between

5 x 5 texture

T(s,t)
Texture interpolation

• (s,t) coordinates typically not directly at pixel in the texture, but in between
• Solutions:
  – Use the nearest neighbor to determine color
    » Faster, but worse quality
    » `glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_NEAREST);`
  – Linear interpolation
    » Incorporate colors of several neighbors to determine color
    » Slower, better quality
    » `glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR)`
Filtering

- Texture image is shrunk in distant parts of the image
- This leads to aliasing
- Can be fixed with filtering
  - bilinear in space
  - trilinear in space and level of detail (mipmapping)
Mipmapping

- Pre-calculate how the texture should look at various distances, then use the appropriate texture at each distance
- Reduces / fixes the aliasing problem
Mipmapping

• Each mipmap (each image below) represents a level of depth (LOD).
• Decrease image 2x at each level
Mipmapping in OpenGL

• Generate mipmaps automatically (for the currently bound texture):

  Core profile:
  `glGenerateMipmap(GL_TEXTURE_2D);`

  Compatibility profile:
  `gluBuild2DMipmaps(GL_TEXTURE_2D, components, width, height, format, type, data)`

• Must also instruct OpenGL to use mipmaps:

  `glTexParameteri(GL_TEXTURE_2D, GL_TEXTURE_MIN_FILTER, GL_LINEAR_MIPMAP_LINEAR)`
Outline

• Introduction
• Filtering and Mipmaps
• Non-color texture maps
• Texture mapping in OpenGL
Textures do not have to represent color

- Specularity (patches of shininess)
- Transparency (patches of clearness)
- Normal vector changes (bump maps)
- Reflected light (environment maps)
- Shadows
- Changes in surface height (displacement maps)
Bump mapping

• How do you make a surface look *rough*?
  – Option 1: model the surface with many small polygons
  – Option 2: perturb the normal vectors before the shading calculation
    » Fakes small displacements above or below the true surface
    » The surface doesn’t actually change, but shading makes it look like there are irregularities!
    » A texture stores information about the “fake” height of the surface
Bump mapping

- We can perturb the normal vector without having to make any actual change to the shape.

- This illusion can be seen through—how?

Original model (5M)  Simplified (500)  Simple model with bump map
Light Mapping

- *Quake* uses *light maps* in addition to texture maps. Texture maps are used to add detail to surfaces, and light maps are used to store pre-computed illumination. The two are multiplied together at run-time, and cached for efficiency.
Outline

• Introduction
• Filtering and Mipmaps
• Non-color texture maps
• Texture mapping in OpenGL
OpenGL Texture Mapping (Core Profile)

• **During initialization:**
  1. Read texture image from file into an array in memory, or generate the image using your program
  2. Initialize the texture (*glTexImage2D*)
  3. Specify texture mapping parameters:
     » Repeat/clamp, filtering, mipmapming, etc.
  4. Make VBO for the texture coordinates
  5. Create VAO

• **In display():**
  1. Bind VAO
  2. Select the texture unit, and texture (using *glBindTexture*)
  3. Render (e.g., *glDrawArrays*)
Read texture image from file into an array in memory

- Can use our ImageIO library

- `ImageIO * imageIO = new ImageIO();
  if (imageIO->loadJPEG(imageFilename) != ImageIO::OK)
    {
      cout << “Error reading image “ << imageFilename << “.” << endl;
      exit(EXIT_FAILURE);
    }

- See starter code for hw2
Initializing the texture

- Do once during initialization, for each texture image in the scene, by calling `glTexImage2D`

- The dimensions of texture images must be a multiple of 4 (Note: they do NOT have to be a power of 2)

- Can load textures dynamically if GPU memory is scarce:

  Delete a texture (if no longer needed) using `glDeleteTextures`
glTexImage2D

- `glTexImage2D(GL_TEXTURE_2D, level, internalFormat, width, height, border, format, type, data)`

- **GL_TEXTURE_2D**: specifies that it is a 2D texture
- **Level**: used for specifying levels of detail for mipmapping (default: 0)
- **InternalFormat**
  - Often: GL_RGB or GL_RGBA
  - Determines how the texture is stored internally
- **Width, Height**
  - The size of the texture must be a multiple of 4
- **Border** (often set to 0)
- **Format, Type**
  - Specifies what the input data is (GL_RGB, GL_RGBA, …)
  - Specifies the input data type (GL_UNSIGNED_BYTE, GL_BYTE, …)
  - Regardless of Format and Type, OpenGL converts the data to internalFormat
- **Data**: pointer to the image buffer
Texture Initialization

Global variable:
GLUint texHandle;

During initialization:

// create an integer handle for the texture
glGenTextures(1, &texHandle);

int code = initTexture("sky.jpg", texHandle);
if (code != 0)
{
    printf("Error loading the texture image.\n");
    exit(EXIT_FAILURE);
}

Function initTexture() is given in the starter code for hw2.
VBO Layout: positions, texture coordinates (for 2 vertices)

4 bytes per floating-point value

VBO

```
| gg5'|53vs|ff&$|#422|424d|^^3d|aa7y|oarT|J^23|Gr/% |
```

pos1  pos1  pos1  pos2  pos2  pos2  tc1  tc1  tc2  tc2
x      y      z      x      y      z      u      v      u      v

in vec3 position

in vec2 texCoord
#version 150

in vec3 position;  // input vertex position and texture coordinates
in vec2 texCoord;

out vec2 tc;  // output texture coordinates; they will be passed to the fragment program (interpolated by hardware)

uniform mat4 modelViewMatrix;  // transformation matrices
uniform mat4 projectionMatrix;

void main()
{
    // compute the transformed and projected vertex position (into gl_Position)
    gl_Position = projectionMatrix * modelViewMatrix * vec4(position, 1.0f);
    // pass-through the texture coordinate
    tc = texCoord;
}
Texture Shader: Fragment Program

#version 150

in vec2 tc; // input tex coordinates (computed by the interpolator)
out vec4 c; // output color (the final fragment color)
uniform sampler2D textureImage; // the texture image

void main()
{
    // compute the final fragment color,
    // by looking up into the texture map
    c = texture(textureImage, tc);
}
VAO code ("texCoord" shader variable)

During initialization:

```c
glBindVertexArray(vao); // bind the VAO

// bind the VBO “buffer” (must be previously created)
glBindBuffer(GL_ARRAY_BUFFER, buffer);

// get location index of the “texCoord” shader variable
GLuint loc = glGetUniformLocation(program, "texCoord");
glEnableVertexAttribArray(loc); // enable the “texCoord” attribute

// set the layout of the “texCoord” attribute data
const void * offset = (const void*) sizeof(positions); GLint stride = 0;
glVertexAttribPointer(loc, 2, GL_FLOAT, GL_FALSE, stride, offset);
```
Multitexturing

- The ability to use *multiple* textures simultaneously in a shader
- Useful for bump mapping, displacement mapping, etc.
- The different texture units are denoted by GL_TEXTURE0, GL_TEXTURE1, GL_TEXTURE2, etc.
- In simple applications (our homework), we only need one unit

```c
void setTextureUnit(GLint unit)
{
    glActiveTexture(unit); // select the active texture unit
    // get a handle to the “textureImage” shader variable
    GLint h_textureImage = glGetUniformLocation(program, “textureImage”);
    // deem the shader variable “textureImage” to read from texture unit “unit”
    glUniform1i(h_textureImage, unit - GL_TEXTURE0);
}
```
The display function

```c
void display()
{
    // put all the usual code here (clear screen, set up camera, upload
    // the modelview matrix and projection matrix to GPU, etc.)
    // …

    // select the active texture unit
    setTextureUnit(GL_TEXTURE0); // it is safe to always use GL_TEXTURE0
    // select the texture to use ("texHandle" was generated by glGenTextures)
    glBindTexture(GL_TEXTURE_2D, texHandle);

    // here, bind the VAO and render the object using the VAO (as usual)
    // …

    glutSwapBuffers();
}
```
Texture mapping in OpenGL (Compatibility Profile)

• During your initialization:
  1. Read texture image from file into an array in memory, or generate the image using your program
  2. Specify texture mapping parameters
     » Wrapping, filtering, etc.
  3. Initialize and activate the texture

• In display():
  1. Enable OpenGL texture mapping
  2. Draw objects: Assign texture coordinates to vertices
  3. Disable OpenGL texture mapping
Enable/disable texture mode (Compatibility Profile)

• Must be done before rendering any primitives that are to be texture-mapped
  • glEnable(GL_TEXTURE_2D)
  • glDisable(GL_TEXTURE_2D)

• Successively enable/disable texture mode to switch between drawing textured/non-textured polygons

• Changing textures:
  – Only one texture is active at any given time (with OpenGL extensions, more than one can be used simultaneously; this is called multitexturing)
  – Use glBindTexture to select the active texture
void display()
{
  ...
  // no modulation of texture color with lighting; use texture color directly
  glTexEnvf(GL_TEXTURE_ENV, GL_TEXTURE_ENV_MODE, GL_REPLACE);

  // turn on texture mapping (this disables standard OpenGL lighting, unless in GL_MODULATE mode)
  glEnable(GL_TEXTURE_2D);

  (continues on next page)
Rendering (compatibility profile) (part 2)

```c
// draw a textured quad
glBegin(GL_QUADS);
glTexCoord2f(0.0,0.0); glVertex3f(-2.0,-1.0,0.0);
glTexCoord2f(0.0,1.0); glVertex3f(-2.0,1.0,0.0);
glTexCoord2f(1.0,0.0); glVertex3f(0.0,1.0,0.0);
glTexCoord2f(1.0,1.0); glVertex3f(0.0,-1.0,0.0);
glEnd();

// turn off texture mapping
glDisable(GL_TEXTURE_2D);

// draw some non-texture mapped objects
// (standard OpenGL lighting will be used if it is enabled)
...
// switch back to texture mode, etc.
...

} // end display()
```
